

POWDER CORES

Molypermalloy | High Flux | Kool M μ [®] | XFLUX[®]

We offer the confidence of over fifty years of expertise in the research, design, manufacture and support of high quality magnetic materials and components.

A major manufacturer of the highest performance materials in the industry including: MPP, High Flux, Kool M μ [®], XF_{LUX}[®], power ferrites, high permeability ferrites and strip wound cores, Magnetics' products set the standard for providing consistent and reliable electrical properties for a comprehensive range of core materials and geometries. Magnetics is the best choice for a variety of applications ranging from simple chokes and transformers used in telecommunications equipment to sophisticated devices for aerospace electronics.

Magnetics backs its products with unsurpassed technical expertise and customer service. Magnetics' Sales Engineers offer the experience necessary to assist the designer from the initial design phase through prototype approval. Knowledgeable Sales Managers provide dedicated account management. Skilled Customer Service Representatives are easily accessible to provide exceptional sales support. This support, combined with a global presence via a worldwide distribution network, including a Hong Kong distribution center, makes Magnetics a superior supplier to the international electronics industry.

Introduction

Magnetics Molypermalloy Powder (MPP) cores are distributed air gap toroidal cores made from a 81% nickel, 17% iron, and 2% molybdenum alloy powder for the lowest core losses of any powder core material. MPP cores (and all powder cores) exhibit soft saturation, which is a significant design advantage compared with gapped ferrites. Also, unlike ferrites, the MPP saturation curve does not need to be derated with increasing device temperature.

MPP cores possess many outstanding magnetic characteristics, such as high resistivity, low hysteresis and eddy current losses, excellent inductance stability after high DC magnetization or under high DC bias conditions and minimal inductance shift under high AC excitation.

MPP THINZ[®], or washer cores, put the premium performance of Magnetics' superior MPP material into robust, low height toroid form, for low profile inductors. With MPP THINZ, exact permeability and height are easily adjusted to result in the optimum design for each application.

Magnetics High Flux powder cores are distributed air gap toroidal cores made from a 50% nickel - 50% iron alloy powder for the highest biasing capability of any powder core material. High Flux cores have advantages that result in superior performance in certain applications involving high power, high DC bias, or high AC excitation amplitude. The High Flux alloy has saturation flux density that is twice that of MPP alloy, and three times or more than that of ferrite. As a consequence, High Flux cores can support significantly more DC Bias current or AC flux density.

High Flux offers much lower core losses and superior DC bias compared with powdered iron cores. High Flux cores offer lower core losses and similar DC bias compared with XF_{LUX} cores.

Frequently, High Flux allows the designer to reduce the size of an inductive component compared with MPP, powdered iron, or ferrite.

Magnetics Kool M μ [®] powder cores are distributed air gap cores made from a ferrous alloy powder for low losses at elevated frequencies. The near zero magnetostriction alloy makes Kool M μ ideal for eliminating audible frequency noise in filter inductors. In high frequency applications, core losses of powdered iron, for instance, can be a major factor in contributing to undesirable temperature rises. Kool M μ cores are superior because their losses are significantly less, resulting in lower temperature rises. Kool M μ cores generally offer a reduction in core size, or an improvement in efficiency, compared with powdered iron cores.

Inductors built with Kool M μ cores do not have several of the disadvantages that are inherent with gapped ferrite cores:

1. Ferrite saturation flux density is 0.5T or less, which is less than half of the flux density of Kool M μ alloy. This results in much less energy storage possible in the same volume with ferrite.
2. Moreover, saturation flux density in ferrites is reduced significantly at elevated temperatures, but in Kool M μ it is not.
3. Ferrites exhibit sharp saturation, and thus risk complete collapse of inductance above a certain safe current level. Kool M μ 's saturation is soft, allowing for safe design to much higher currents.
4. Fringing losses at the discrete air gap in a ferrite inductor can be disastrous, a problem that is completely absent with Kool M μ .

Kool M μ is available in a variety of core types, for maximum flexibility. Toroids offer compact size and self-shielding. E cores and U cores afford lower cost of winding, use of foil inductors, and ease of fixturing. Very large cores and structures are available to support very high current applications. These include toroids up to 102 mm, 133 mm and 165 mm; jumbo E cores; U cores; stacked shapes; and blocks.

Magnetics XF_{LUX}[®] distributed air gap cores are made from 6.5% silicon iron powder. XF_{LUX} offers lower losses than powdered iron cores and superior DC bias performance. The soft saturation of XF_{LUX} material offers an advantage over ferrite cores. XF_{LUX} cores are ideal for low and medium frequency chokes where inductance at peak load is critical.

All Magnetics Kool M μ [®], XF_{LUX}[®], MPP and High Flux are true high temperature materials, with no thermal aging.

Magnetics is committed to meeting global environmental standards and initiatives. Magnetics' REACH and RoHS compliance statements and reports are available on our website: www.mag-inc.com

Applications

Magnetics powder cores are most commonly used in power inductor applications, specifically in switch-mode power supply (SMPS) filter inductors, also known as DC inductors or chokes. Other power applications include differential inductors, boost inductors, buck inductors and flyback transformers.

While all four materials are used in these applications, each has its own advantages. For the lowest loss inductor, MPP material should be used since it has the lowest core loss. For the smallest package size in a DC bias dominated design, High Flux material should be used since it has the

highest flux capacity. XF_{LUX}® can be a lower cost alternative to High Flux, in situations where the higher core losses and more limited permeability availability of XF_{LUX} is acceptable.

The unique advantages of Magnetics' powder cores are used in a variety of other applications, including: High Q filters, high reliability inductors and filters, high temperature inductors and filters, high current CTs, telecom filters, and load coils.

	MPP	High Flux	Kool M μ ®	XF _{LUX} ®
Permeability	14-550	14-160	26-125	26-60
Core Loss	Lowest	Moderate	Low	High
Perm vs. DC Bias	Better	Best	Good	Best
Temperature Stability	Best	Very Good	Very Good	Good
Temperature Rating	200°C continuous	200°C continuous	200°C continuous	200°C continuous
Saturation Characteristic	Soft	Soft	Soft	Soft
Nickel Content	81%	50%	0%	0%
Relative Cost	High	Medium	Low	Low

A lower cost family of alternative products to Magnetics' four premium powder core materials are powdered irons. Manufacturers of powdered iron use a different production process. For comparison with the above table, powdered irons have permeabilities from 10 -100; highest core loss; good perm vs. DC bias; fair temperature stability; lower temperature ratings; soft saturation; 0% nickel content; lowest relative cost.

Kool M μ and powdered iron cores have comparable DC Bias performance. The advantages of Kool M μ compared with powdered iron include (1) lower core losses; (2) no thermal aging, since Kool M μ is manufactured without the use of organic binders; (3) near zero magnetostriction, which means that Kool M μ can be useful for addressing audible noise problems; and (4) better stability of permeability vs. AC flux density.

Core Identification

All Magnetics powder cores have unique part numbers that provide important information about the characteristics of the cores. A description of each type of part number is provided below.

TOROIDS

C 0 5 5 2 0 6 A 2

Core Finish Code	Voltage Breakdown	Material Availability	OD Size Availability
A2	2,000 V _{AC} min	MPP, High Flux	All
A7	2,000 V _{AC} min	Kool M μ [®] , XFlux [®]	All
AY	600 V _{AC} min	All	3.56 - 16.5 mm
A5	2,000 V _{AC} min	All	6.35 - 23.6 mm
A9	8,000 V _{AC} min	All	>4.65 mm

Catalog Number (designates size and permeability)

Material Code 55 = MPP
58 = High Flux
77 = Kool M μ
78 = XFlux

Grading Code CO = Graded into 2% inductance bands – OD <4.65 mm, 5% bands
OO = Not graded

• No voltage breakdown min for A2 or A7 with OD \leq 4.65mm

• A2 and A7 voltage breakdown is 1000 V_{AC} with 4.65mm < OD < 26.9mm

• AY finish not available for 550 μ MPP

• All values wire to wire

Powder Core Toroid Stamping Summary

Size (OD mm)	6-digit Shop Order Number	2-digit Material Code	3-digit Catalog Number	2-digit Core Finish Code	Inductance Code	Stamping Example
6.35 - 6.86	✓		✓		✓	123456 020 +6
7.87 - 12.7	✓		✓	✓	✓	123456 050A2 +6
> 12.7	✓	✓	✓	✓	✓	123456 55120A2 +6

- Inductance Code is only stamped on MPP toroids with CO Grading Code
- Cores with OD < 6.35 mm are not stamped

- Shop order number identifies the product batch, ensuring traceability of every core through the entire manufacturing process, back to raw materials

Shape Code LE = Large E Core

Size Code

Material Code M = MPP
H = High Flux
K = Kool M μ

Grading Code OO = Not graded

Inductance and Grading

Measured vs. Calculated Inductance

A_L (Inductance factor) is given for each core in this catalog. Inductance for blocks is tested in standard picture frame arrangements. Units for A_L are nH/T². A_L is related to nominal calculated inductance (L_N , in μ H) by the number of turns, N .

$$L_N = A_L N^2 10^{-3}$$

Magnetics' inductance standards are measured in a Kelsall Permeameter Cup. Actual wound inductance measured outside a Kelsall Cup is greater than the nominal calculated value due to leakage flux and flux developed by the current in the winding. The difference depends on many variables; core size, permeability, core coating thickness, wire size and number of turns, in addition to the way in which the windings are put on the core. The difference is negligible for permeabilities above 125 and turns greater than 500. However, the lower the permeability and/or number of turns, the more pronounced this deviation becomes.

Example : C055930A2 (26.9 mm, 125 μ , p. 72)

Number of Turns	Calculated Inductance	Measured Inductance
1,000	157 mH	+0.0%
500	39.3 mH	+0.5%
300	14.1 mH	+1%
100	1.57 mH	+3%
50	393 μ H	+5%
25	98.1 μ H	+9%

The following formula can be used to approximate the leakage flux to add to the expected inductance. This formula was developed from historical data of cores tested at Magnetics. Be aware that this will only give an approximation based on evenly spaced windings. You may expect as much as a $\pm 50\%$ deviation from this result.

$$L_{LK} = \frac{0.292 N^{1.065} A_e}{l_e} \quad \text{where:}$$

L_{LK} = leakage inductance adder (μ H)

N = number of turns

A_e = core cross section (mm^2)

l_e = core magnetic path length (mm)

Example: C055930A2 with 25 turns (p. 72)

Catalog Data	Calculated Inductance
$A_L = 157 \text{ nH/T}^2$	$L_N = (157)(25)^2 10^{-3}$
$A_e = 65.4 \text{ mm}^2$	$= 98.1 \mu\text{H}$
$l_e = 63.5 \text{ mm}$	
Leakage Adder	Estimated Measured Inductance
$L_{LK} = \frac{0.292(25)^{1.065}(65.4)}{63.5}$	$L = L_N + L_{LK}$
$= 9.3 \mu\text{H}$	$= 98.1 + 9.3$
	$= 107 \mu\text{H}$

Core Inductance Tolerance and Grading

Magnetics powder cores are precision manufactured to an inductance tolerance of $\pm 8\%$ *, using standard Kelsall Permeameter Cup measurements with a precision series inductance bridge.

MPP and High Flux cores with outside diameters $> 4.65 \text{ mm}$ are graded into 2% inductance bands as a standard practice at no additional charge. Core grading can reduce winding costs by minimizing turns adjustments when building high turns inductors to very tight inductance specifications. MPP cores 4.65 mm and smaller are graded into 5% bands. 14 μ cores, 26 μ cores, MPP THINZ® and parylene coated cores are not graded.

Graded Magnetics MPP cores and High Flux cores are also available with tolerances tighter than the standard $\pm 8\%$.

*THINZ and Kool M μ cores with OD $< 12.7 \text{ mm}$ have wider tolerances.

GRADE Stamped on Core OD	INDUCTANCE % Deviation from Nominal		TURNS % Deviation from Nominal	
	From	To	From	To
+8	+8	+7	-4.0	-3.5
+6	+7	+5	-3.5	-2.5
+4	+5	+3	-2.5	-1.5
+2	+3	+1	-1.5	-0.5
+0	+1	-1	-0.5	+0.5
-2	-1	-3	+0.5	+1.5
-4	-3	-5	+1.5	+2.5
-6	-5	-7	+2.5	+3.5
-8	-7	-8	+3.5	+4.0

Core Coating

Magnetics toroidal powder cores are coated with a special epoxy finish that provides a tough, wax tight, moisture and chemical resistant barrier having excellent dielectric properties. Parylene coating is also offered.

Material	Color	Core Finish Codes
MPP	Gray	A2, A5, A9
High Flux	Khaki	A2, A5, A9
Kool M μ [®]	Black	A7, A5, A9
XFLux [®]	Brown	A7, A5, A9

The finish is tested for voltage breakdown by inserting a core between two weighted wire mesh pads. Force is adjusted to produce a uniform pressure of 10 psi, simulating winding pressure. The test condition for each core in the random sample set, to guarantee minimum breakdown voltage in each production batch, is 60 Hz rms voltage at 1.25 the guaranteed limit. A2 and A7 samples (26.9 mm and larger) are tested to 2500 V min wire-to-wire. AY samples are tested to 750 V min wire-to-wire.

Higher minimum breakdown coatings can be applied upon request for cores larger than 4.65 mm.

Toroids as large as 16.5 mm outside diameter can be coated with parylene to minimize the constriction of the inside diameter. All finished dimensions in this catalog are for epoxy coating (A2 or A7). For a parylene coated toroid (AY), the maximum OD and HT are reduced by 0.18 mm (0.007"), and the minimum ID is increased by 0.18 mm (0.007").

The maximum steady-state operating temperature for epoxy coating is 200°C. The maximum steady-state operating temperature for parylene coating is 130°C, but it can be used as high as 200°C for short periods, such as during board soldering. High temperature operation of Magnetics powder cores does not affect magnetic properties.

MPP, High Flux, Kool M μ , and XFLux materials can be operated continuously at 200°C with no aging or damage.

NOTE: Special powder grades and processing were historically used with MPP for passive filter inductors. For information regarding D4, W4, M4 and L6 codes, or precision inductor processing, contact Magnetics.

Inductor Core Selection Procedure

Only two parameters of the design application must be known to select a core for a current-limited inductor; inductance required with DC bias and the DC current. Use the following procedure to determine the core size and number of turns.

1. Compute the product of LI^2 where:
 L = inductance required with DC bias (mH)
 I = DC current (A)
2. Locate the LI^2 value on the Core Selector Chart (page 20, 21 & 22). Follow this coordinate to the intersection with the first core size that lies above the diagonal permeability line. This is the smallest core size that can be used.
3. The permeability line is sectioned into standard available core permeabilities. Selecting the permeability indicated will tend to be the best trade-off between A_L and DC bias.
4. Inductance, core size, and permeability are now known. Calculate the number of turns by using the following procedure:

- (a) The inductance factor (A_L in nH/T²) for the core is obtained from the core data sheet. Determine the minimum A_L by using the worst case negative tolerance (generally -8%). With this information, calculate the number of turns needed to obtain the required inductance from:

$$N = \sqrt{\frac{L \cdot 10^3}{A_L}}$$

Where L is required inductance (μ H)

- (b) Calculate the bias in A·T/cm from:

$$H = \frac{NI}{l_e}$$
- (c) From the Permeability vs. DC Bias curves (pages 26 through 28), determine the rolloff percentage of initial permeability for the previously calculated bias level. Curve fit equations shown in the catalog can simplify this step. They are also available to use on Magnetics website: <http://www.mag-inc.com/design/design-guides/Curve-Fit-Equation-Tool>
- (d) Multiply the required inductance by the percentage rolloff to find the inductance with bias current applied.

- (e) Increase the number of turns by dividing the initial number of turns (from step 4(a)) by the percentage rolloff. This will yield an inductance close to the required value after steps 4 (b), (c) and (d) are repeated.

- (f) Iterate steps 4 (b), (c) and (d) if needed to adjust turns up or down until the biased inductance is satisfactorily close to the target.

5. Choose a suitable wire size using the Wire Table (page 23). Duty cycles below 100% allow smaller wire sizes and lower winding factors, but do not allow smaller core sizes.

6. Design Checks

- (a) **Winding Factor.** See p.13 for notes on checking the coil design.

- (b) **Copper Losses.** See p.13 for notes on calculating conductor resistance and losses.

- (c) **Core Losses.** See p.14 for notes on calculating AC core losses. If AC losses result in too much heating or low efficiency, then the inductor may be loss-limited rather than current-limited. Design alternatives for this case include using a larger core or a lower permeability core to reduce the AC flux density; or using a lower loss material such as MPP in place of Kool M μ , or High Flux in place of X_{FLUX}.

- (d) **Temperature Rise.** Dissipation of the heat generated by conductor and core losses is influenced by many factors. This means there is no simple way to predict temperature rise (ΔT) precisely. But the following equation is known to give a useful approximation for a component in still air. Surface areas for cores wound to 40% fill are given with the core data in this catalog.

$$\Delta T (^{\circ}\text{C}) = \left(\frac{\text{Total Losses (mW)}}{\text{Component Surface Area (cm}^2\text{)}} \right)^{0.833}$$

Core Selection Example

Determine core size and number of turns to meet the following requirement:

- (a) Minimum inductance with DC bias of 0.6 mH (600 μ H)
- (b) DC current of 5.0 A

1. $LI^2 = (0.6)(5.0)^2 = 15.0 \text{ mH}\cdot\text{A}^2$
2. Using the Kool M μ Toroids LI^2 chart found on page 21, locate 15 mH \cdot A² on the bottom axis. Following this coordinate vertically results in the selection of 0077083A7 as an appropriate core for the above requirements.
3. From the 0077083A7 core data page 76, the inductance factor (A_L) of this core is 81 nH/T² \pm 8%. The minimum A_L of this core is 74.6 nH/T².
4. The number of turns needed to obtain 600 μ H at no load is 90 turns. To calculate the number of turns required at full load, determine the DC bias level: $H = N/l_e$ where l_e is the path length in cm. The DC bias is 45.7 A \cdot T/cm, yielding 69% of initial permeability from the 60 μ Kool M μ DC bias curve on page 27. The adjusted turns are $90/0.69 = 131$ Turns.
5. Re-calculate the DC bias level. The permeability versus DC bias curve shows 54% of initial permeability at 66.6 A \cdot T/cm.
6. Multiply the minimum A_L 74.6 nH/T² by 0.54 to yield effective $A_L = 40.3$ nH/T². The inductance of this core with 131 turns and with 66.6 A \cdot T/cm will be 691 μ H minimum. The inductance requirement has been met.
7. The wire table indicates that 17 AWG is needed to carry 5.0 A with a current density of 500 A/cm². 131 turns of 17 AWG (wire area = 1.177 mm²) equals a total wire area of 154 mm². The window area of a 0077083A7 is 427 mm². Calculating window fill, 154 mm²/427 mm² corresponds to an approximate 36% winding factor. A 0077083A7 with 131 turns of 17 AWG is a manufacturable design.

Toroid Winding

Winding Factor

Winding factor, also called fill factor, is the ratio of total conductor cross section (usually copper cross section) to the area of the core window. In other words, in a toroid, winding factor is given by:

$$\text{where: } \frac{N \cdot A_W}{W_A} = \frac{\pi}{4} \cdot ID^2$$

N = Number of turns
 A_W = Area of the wire
 W_A = Window Area of the core

Toroid Core Winding factors can vary from 20-60%, a typical value in many applications being 35-40%.

In practice, several approaches to toroid winding are used:

- Single layer: The number of turns is limited by the inside circumference of the core divided by the wire diameter. Advantages are lower winding capacitance, more repeatable parasitics, good cooling, and low cost. Disadvantages are reduced power handling and higher flux leakage.
- Low fill: For manufacturing ease and reduced capacitance, winding factor between single layer and 30% may be used.
- Full winding: Factors between 30% and 45% are normally a reasonable trade off between fully utilizing the space available for a given core size, while avoiding excessive manufacturing cost.
- High fill: Winding factors up to about 65% are achievable, but generally only with special expensive measures, such as completing each coil by hand after the residual hole becomes too small to fit the winding shuttle.

Estimating Wound Coil Dimensions

For each core size, wound coil dimensions are given for 40% winding factor, since this is a typical, practical value. Worst case package dimensions for coils wound completely full are also shown. These are max expected OD and max expected HT.

To estimate dimensions for other winding factors, use:

$$OD_{x\%} = \sqrt{\frac{X\%}{40\%} (OD_{40\%}^2 - OD_{core}^2) + OD_{core}^2}$$

$$HT_{x\%} = ID_{core} + HT_{core} - \sqrt{\frac{100\% - X\%}{60\%} (ID_{core} + HT_{core} - HT_{40\%})}$$

Where: X% is the new winding factor;
 $OD_{40\%}$ and $HT_{40\%}$ are the coil dimensions shown on the core data page;
 OD_{core} and HT_{core} are the maximum core dimensions after finish.

MLT and DCR

MLT (Mean Length of Turn) is given for a range of winding factors for each core size. To estimate DCR, first, calculate the winding factor for the core, wire gauge, and number of turns selected. On the wire table look up resistance per unit of length for the gauge selected. On the data page for the core selected, consult the Winding Turn Length chart. Unless the winding factor is exactly one of the values listed, interpolate to find the MLT. Then,

$$DCR = (MLT)(N) (\Omega/\text{Length}).$$

For single layer winding, MLT is the 0% fill value on each core data page. Even easier, DCRs for single layer windings for a range of wire gauges are given in the winding tables on pages 96-99.

Wire Loss

DC copper loss is calculated directly as I^2R . Naturally, for aluminum conductors, a suitable wire table must be used. Also, the increase of wire resistance with temperature should be considered.

AC copper loss can be significant for large ripple and for high frequency. Unfortunately, calculation of AC copper loss is not a straight-forward matter. Estimates are typically used.

Powder Core Loss Calculation

Core loss is generated by the changing magnetic flux field within a material, since no magnetic materials exhibit perfectly efficient magnetic response. Core loss density (PL) is a function of half of the AC flux swing ($\frac{1}{2} \Delta B = B_{pk}$) and frequency (f). It can be approximated from core loss charts or the curve fit loss equation:

$$PL = aB_{pk}^b f^c$$

where a, b, c are constants determined from curve fitting, and B_{pk} is defined as half of the AC flux swing:

$$B_{pk} = \frac{\Delta B}{2} = \frac{B_{ACmax} - B_{ACmin}}{2}$$

Units typically used are (mW/cm³) for PL; Tesla (T) for B_{pk} ; and (kHz) for f .

The task of core loss calculation is to determine B_{pk} from known design parameters.

Method 1 – Determine B_{pk} from DC Magnetization Curve. $B_{pk} = f(H)$

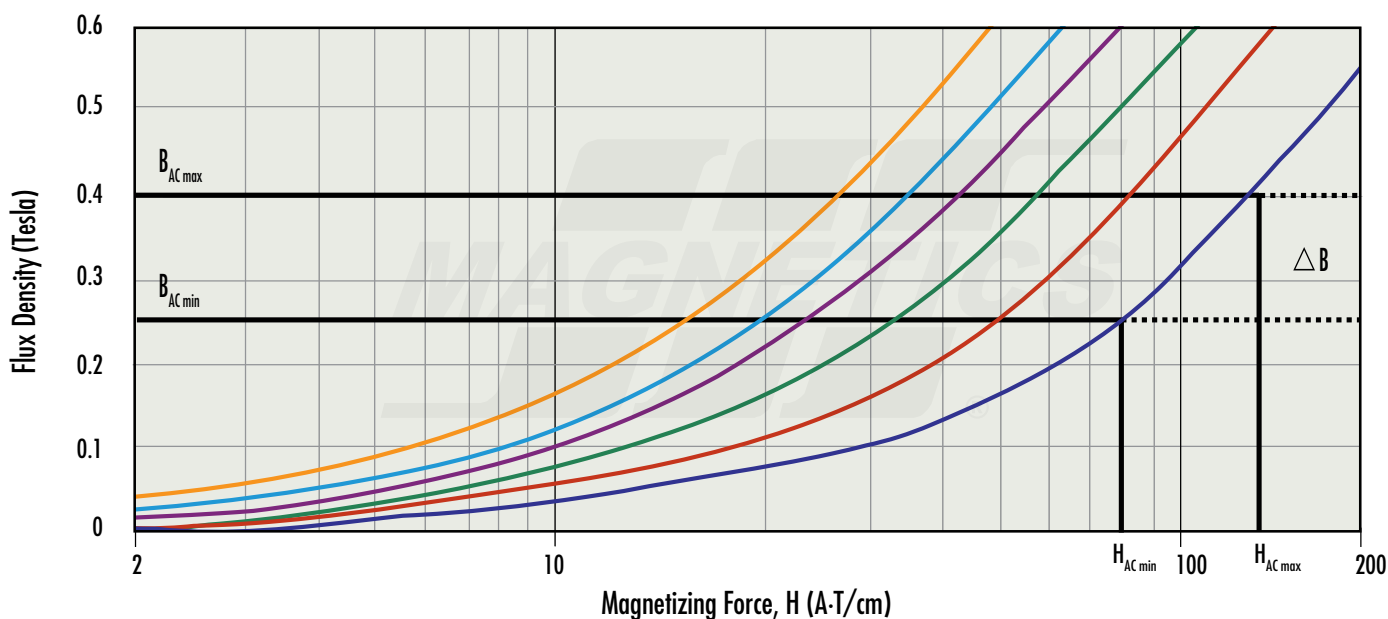

Flux density (B) is a non-linear function of magnetizing field (H), which in turn is a function of winding number of turns (N), current (I), and magnetic path length (l_e). The value of B_{pk} can typically be determined by first calculating H at each AC extreme:

$$H_{ACmax} = \left[\frac{N}{l_e} \left(I_{DC} + \frac{\Delta I}{2} \right) \right]$$

$$H_{ACmin} = \left[\frac{N}{l_e} \left(I_{DC} - \frac{\Delta I}{2} \right) \right]$$

Units typically used are (A·T/cm) for H.

From H_{ACmax} , H_{ACmin} , and the BH curve (or BH curve fit equation), B_{ACmax} , B_{ACmin} and therefore B_{pk} can be determined.

Example 1 - AC current is 10% of DC current:

Approximate the core loss of an inductor with 20 turns wound on Kool Mμ p/n 77894A7 p. 72 (60μ , $l_e=6.35$ cm, $A_e=0.654$ cm², $A_L=75$ nH/T²). Inductor current is 20 Amps DC with ripple of 2 Amps peak-peak at 100kHz.

1.) Calculate H and determine B from BH curve or curve fit equation p. 41:

$$H_{ACmax} = \frac{20}{6.35} \left(20 + \frac{2}{2} \right) = 66.14 \text{ A·T/cm} \rightarrow B_{ACmax} \cong 0.44\text{T}$$

$$H_{ACmin} = \frac{20}{6.35} \left(20 - \frac{2}{2} \right) = 59.84 \text{ A·T/cm} \rightarrow B_{ACmin} \cong 0.41\text{T}$$

$$\rightarrow B_{pk} = \frac{\Delta B}{2} = \frac{0.44 - 0.41}{2} = 0.015\text{T}$$

2.) Determine Core Loss density from chart or calculate from loss equation p. 36:

$$PL = (193)(0.015^{2.01})(100^{1.20}) \cong 16 \frac{\text{mW}}{\text{cm}^3}$$

3.) Calculate core loss:

$$P_{ie} = (PL)(l_e)(A_e) \sim (16)(6.35)(0.654) \cong 65\text{mW}$$

Powder Core Loss Calculation

Example 2 - AC current is 40% of DC current:

Approximate the core loss for the same 20-turn inductor, with same inductor current of 20 Amps DC but ripple of 8 Amps peak-peak at 100kHz.

1.) Calculate H and determine B from BH curve fit equation p. 41:

$$H_{ACmax} = \frac{20}{6.35} \left(20 + \frac{8}{2} \right) = 75.59 \text{ A-T/cm} \rightarrow B_{ACmax} \cong 0.48\text{T}$$

$$H_{ACmin} = \frac{20}{6.35} \left(20 - \frac{8}{2} \right) = 50.39 \text{ A-T/cm} \rightarrow B_{ACmin} \cong 0.36\text{T}$$

$$\rightarrow B_{pk} = \frac{\Delta B}{2} = \frac{0.48 - 0.36}{2} = 0.06\text{T}$$

2.) Determine Core Loss density from chart or calculate from loss equation p.36: $PL = (193)(0.06^{2.01})(100^{1.20}) \sim 260 \frac{\text{mW}}{\text{cm}^3}$

3.) Calculate core loss: $P_{fe} = (PL)(l_e)(A_e) = (260)(6.35)(0.654) \sim 1\text{W}$

Note: Core losses result only from AC excitation. DC bias applied to any core does not cause any core losses, regardless of the magnitude of the bias.

Example 3 – pure AC, no DC:

Approximate the core loss for the same 20-turn inductor, now with 0 Amps DC and 8 Amps peak-peak at 100kHz.

1.) Calculate H and determine B from BH curve fit equation p. 41:

$$H_{ACmax} = \frac{20}{6.35} \left(+ \frac{8}{2} \right) = 12.60 \text{ A-T/cm} \rightarrow B_{ACmax} \cong 0.11\text{T}$$

$$H_{ACmin} = \frac{20}{6.35} \left(- \frac{8}{2} \right) = -12.60 \text{ A-T/cm} \rightarrow B_{ACmin} \cong -0.11\text{T}$$

$$\rightarrow B_{pk} = \frac{\Delta B}{2} \sim 0.11\text{T}$$

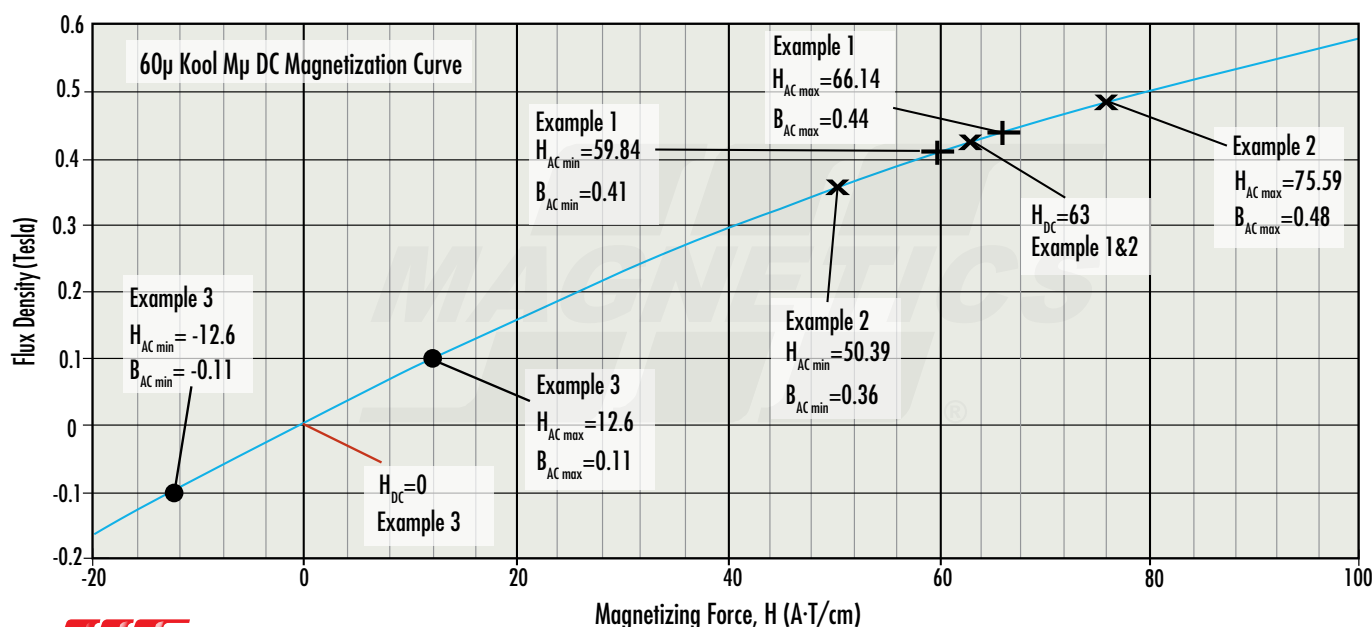

Note: Curve fit equations are not valid for negative values of B . Evaluate for the absolute value of B , then reverse the sign of the resulting H value.

2.) Determine Core Loss density from chart or calculate from loss equation p.36. $PL = (193)(0.11^{2.01})(100^{1.20}) \sim 900 \frac{\text{mW}}{\text{cm}^3}$

3.) Calculate core loss: $P_{fe} = (PL)(l_e)(A_e) = (900)(6.35)(0.654) \sim 4\text{W}$

Plotted below are the operating ranges for each of the three examples.

Note the significant influence of DC bias on core loss, comparing Example 3 with Example 2. Lower permeability results in less B_{pk} , even if the current ripple is the same. This effect can be achieved with DC bias, or by selecting a lower permeability material.

Powder Core Loss Calculation

Method 2, for small ΔH , approximate B_{pk} from effective perm with DC bias.

$$B_{pk} = f(\mu_e, \Delta H)$$

The instantaneous slope of the BH curve is defined as the absolute permeability, which is the product of permeability of free space ($\mu_0 = 4\pi \times 10^{-7}$) and the material permeability (μ), which varies along the BH curve. For small AC, this slope can be modeled as a constant throughout AC excitation, with μ approximated as the effective perm at DC bias (μ_e):

$$\frac{dB}{dH} = \mu_0 \mu_e \rightarrow \frac{\Delta B}{\Delta H} = \mu_0 \mu_e \rightarrow \Delta B = \mu_0 \mu_e \Delta H \quad B_{pk} = \frac{\Delta B}{2} = (0.5) \mu_0 \mu_e \Delta H$$

The effective perm with DC bias is shown in this catalog as % of initial perm and can be obtained from the DC bias curve or curve fit equation:

$$B_{pk} = (0.5)(\mu_0)(\% \mu_i)(\mu_i)(100)(\Delta H) \quad \text{where} \quad \Delta H = \frac{N \Delta I}{l_e}$$

ΔH is multiplied by 100 because l_e is expressed in cm, while B_{pk} units include m.

Reworking Example 1 (20 Amps DC, 2 Amps p-p)

$$H_{DC} = \left[\frac{20}{6.35} (20) \right] = 63 \text{ A}\cdot\text{T}/\text{cm} \rightarrow \text{from curve or curve fit equation, } \% \mu_i = 0.57$$

$$\mu_i = 60$$

$$\Delta H = \frac{N \Delta I}{l_e} = \frac{20(2)}{6.35} = 6.3 \text{ A}\cdot\text{T}/\text{cm}$$

$$B_{pk} = 0.5(4\pi \times 10^{-7})(0.57)(60)(100)(6.3) = 0.014\text{T} \quad (\text{this compares to } 0.015\text{T} \text{ using Method 1})$$

Reworking Example 2 (20 Amps DC, 8 Amps p-p)

From example 1,

$$H_{DC} = 63 \text{ A}\cdot\text{T}/\text{cm}, \% \mu_i = 0.57; \mu_i = 60$$

$$\Delta H = \frac{N \Delta I}{l_e} = \frac{20(8)}{6.35} = 25.2 \text{ A}\cdot\text{T}/\text{cm}$$

$$B_{pk} = 0.5(4\pi \times 10^{-7})(0.57)(60)(100)(25.2) = 0.054\text{T} \quad (\text{this compares to } 0.06\text{T} \text{ using Method 1})$$

Reworking Example 3 (0 Amps DC, 8 Amps p-p)

From example 2,

$$\Delta H = 25.20 \text{ A}\cdot\text{T}/\text{cm}$$

$$H_{DC} = \text{A}\cdot\text{T}/\text{cm} \quad \% \mu_i = 1$$

$$B_{pk} = 0.5(4\pi \times 10^{-7})(1)(60)(100)(25.2) = 0.095\text{T} \quad (\text{this compares to } 0.11\text{T} \text{ using Method 1})$$

Powder Core Loss Calculation

Method 3, for small ΔH , determine B_{pk} from biased inductance. $B_{pk} = f(L, I)$

B can be rewritten in terms of inductance by considering Faraday's equation and its effect on inductor current:

$$V_L = NA \frac{dB}{dt} = L \frac{dI}{dt} \rightarrow dB = \frac{L}{NA} dI$$

L varies non-linearly with I. For small AC, L can be assumed constant throughout AC excitation and is approximated by the biased inductance (L_{DC}).

$$\Delta B = \frac{L_{DC} \Delta I}{NA} \rightarrow B_{pk} = \frac{L_{DC} \Delta I}{2NA_e}$$

Another way of looking at this is by rewriting the relationship between B and L as:

$$\rightarrow \frac{dB}{dH} = \frac{L}{NA} \frac{dI}{dH}$$

Substituting (dH/dI) with (N/I_e) and A with A_e:

$$\rightarrow \frac{dB}{dH} = \frac{L_e}{N^2 A_e}$$

L varies non-linearly with H. For small AC, the slope of the BH curve is assumed constant throughout AC excitation, and L is approximated by the biased inductance (L_{DC}).

$$\frac{\Delta B}{\Delta H} = \frac{L_{DC} I_e}{N^2 A_e} \rightarrow \Delta B = \frac{L_{DC} I_e}{N^2 A_e} \Delta H = \frac{L_{DC} \Delta I}{NA_e} \rightarrow \Delta B_{pk} = \frac{L_{DC} \Delta I}{2NA_e}$$

Powder Core Loss Calculation

Reworking Example 1:

$$L_{nl} (\text{no load}) = (A_L)(N^2) = (75 \text{ nH/T}^2)(20^2) = 30 \mu\text{H}$$

$$L_{DC} (20\text{A}) = (\% \mu_r)(L_{nl}) = (0.57)(30) = 17.1 \mu\text{H}$$

$$\rightarrow B_{pk} = \frac{(17.1)(10^{-6})(2)}{2(20)(0.654)(10^{-4})} = 0.013\text{T} \quad (\text{this compares to } 0.015\text{T per Method 1, } 0.014\text{T per Method 2}).$$

Reworking Example 2:

From example 1, $L_{DC} = 17.1 \mu\text{H}$

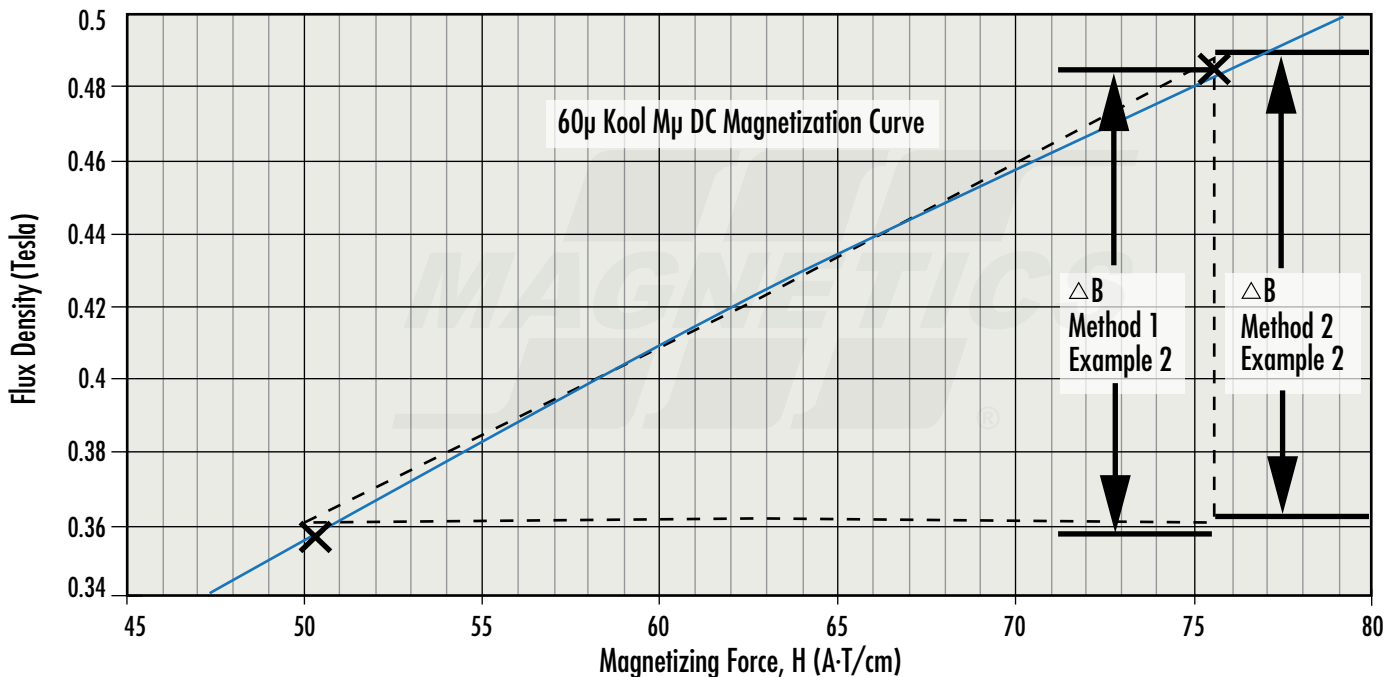

$$\rightarrow B_{pk} = \frac{(17.1)(10^{-6})(8)}{2(20)(0.654)(10^{-4})} = 0.052\text{T} \quad (\text{this compares to } 0.06\text{T per Method 1, } 0.054\text{T per Method 2}).$$

Reworking Example 3:

$$L_{DC} = L_{nl} = 30 \mu\text{H}$$

$$\rightarrow B_{pk} = \frac{(30)(10^{-6})(8)}{2(20)(0.654)(10^{-4})} = 0.092\text{T} \quad (\text{this compares to } 0.11\text{T per Method 1, } 0.095\text{T per Method 2}).$$

The plot below illustrates the difference between Method 1 and Method 2

Core Selector Charts

The core selector charts are a quick guide to finding the optimum permeability and smallest core size for DC bias applications. These charts are based on a permeability reduction of not more than 50% with DC bias, typical winding factors of 40% for toroids and 60% for shapes, and an AC current that is small relative to the DC current. These charts are based on the nominal core inductance and a current density 500-600 A/cm².

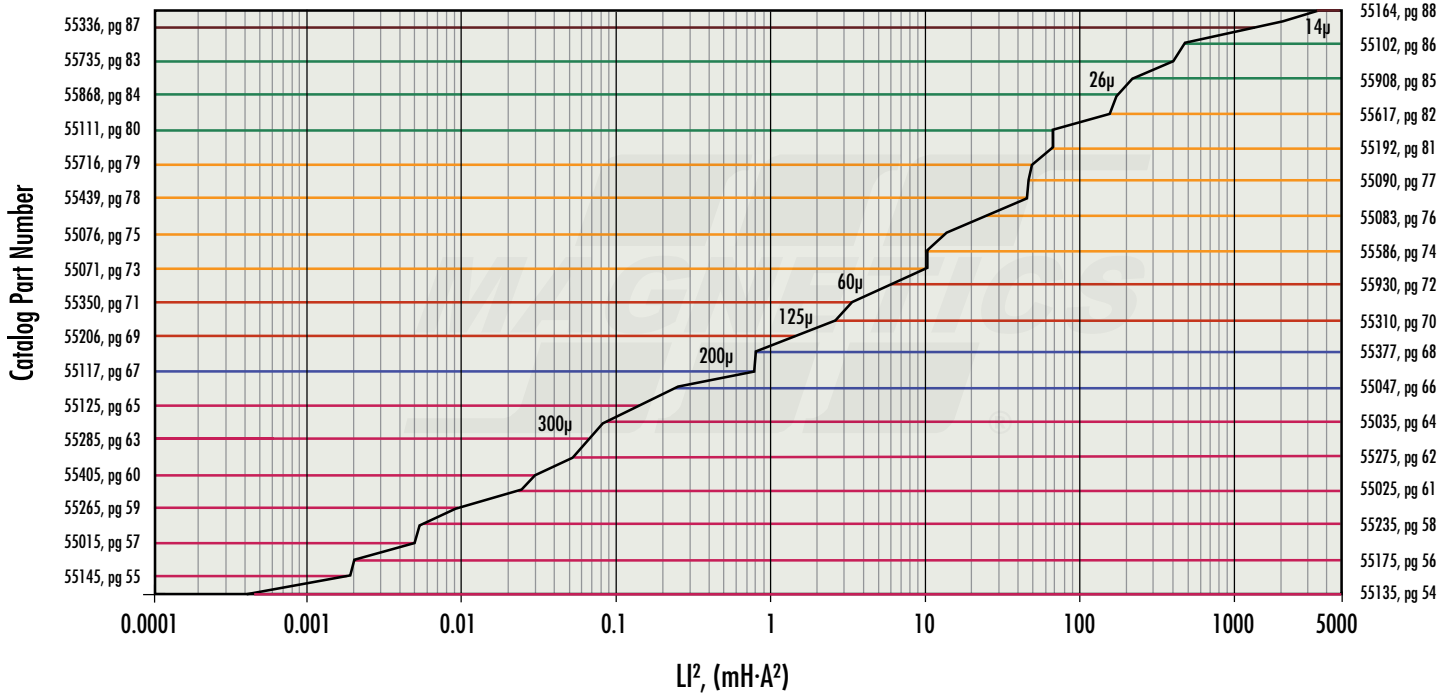

If a core is being selected for use with a large AC current relative to any DC current, such as a flyback inductor or buck/boost inductor, frequently a larger core will be needed to limit the core losses due to AC flux. In other words, the design becomes loss-limited rather than bias-limited.

For additional power handling capability, stacking of cores will yield a proportional increase in power handling. For example, double stacking of the 55908 core will result in doubled power handling capability to about 400 mH·A².

Cores with increased heights are easily ordered. Contact Magnetics for more information.

Core Weights

Core weights listed in this catalog are for 125 μ cores.*

To determine weights for other permeabilities, multiply the 125 μ weight by the following factors:

Permeability	14 μ	26 μ	40 μ	60 μ	75 μ	90 μ	125 μ	147 μ 160 μ 173 μ	200 μ 300 μ	550 μ
x Factor	0.80	0.86	0.90	0.94	0.96	0.97	1.00	1.02	1.03	1.04

*XFLux[®] is based on 60 μ weight.

*MPP, High Flux, and Kool M μ [®] in sizes 102, 337, and 165 weight based on 26 μ .

Unit Conversions

To obtain number of	Multiply number of	By
A-T/cm	oersteds	0.795
oersteds	A-T/cm	1.26
tesla	gauss	0.0001
cm ²	in ²	6.452
cm ²	circular mils	(5.07)(10 ⁶)
Gauss	mT (milli Tesla)	10

Add permeability code*** to part number, e.g., for 26μ Kool Mμ, the complete part number is 00K6527U026.

MPP THINZ[®] Core Data

THINZ are available in four permeabilities, 125 μ , 160 μ , 200 μ , and 250 μ , but the product is designed to be easily customized to any permeability up to 250. The most critical parameter of a power inductor material is its ability to provide inductance, or permeability, under DC bias. The distributed air gap of MPP results in a soft inductance versus DC bias curve.

This swinging inductance is often desirable since it maximizes power handling for a given package size; improves efficiency; accommodates a wide operating range; and provides automatic fault or overload protection.

Special core heights are available, consult Magnetics.

E Core Hardware

Magnetics has bobbins available for use with Kool Mu cores. Refer to Magnetics Ferrite Cores catalog for a complete listing of available bobbins. The cores are standard industry sizes that will fit standard bobbins available from many sources. Core pieces can be

assembled by bonding the mating surfaces or taping around the perimeter of the core set. Caution is advised if metal clamps are considered, since eddy current heating can occur in conductive material that is very close to the surface of low permeability powder core material.

Other Products from Magnetics

Ferrites

Magnetics' ferrite cores are manufactured for a wide variety of applications. Magnetics has developed and produces the leading MnZn ferrite materials for power transformers, power inductors, wideband transformers, common mode chokes, and many other applications. In addition to offering the leading materials, other advantages of ferrites from Magnetics include: the full range of standard planar E, ER, and I cores; the widest range of toroid sizes in power and high permeability materials; standard gapping to precise inductance or mechanical dimension; a wide range of available coil formers and assembly hardware; and superior toroid coatings available in several options.

Power Materials

Five low loss materials are engineered for optimum frequency and temperature performance in power applications. Magnetics' R, P, F, L, and T materials provide superior saturation, high temperature performance, low losses and product consistency.

Shapes: E cores, Planar E cores, ER cores, ETD, EC, U cores, I cores, PQ, Planar PQ, RM, Toroids, Pot cores, RS (round-slab), DS (double slab), EP, Special Shapes.

Applications: Telecomm power supplies, computer power supplies, commercial power supplies, consumer power supplies, automotive, DC-DC converters, telecomm data interfaces, impedance matching transformers, handheld devices, high power control (gate drive), computer servers, distributed power (DC-DC), EMI filters, aerospace, and medical.

High Permeability Materials

Two high permeability materials (5,000 μ J material and 10,000 μ W material) are engineered for optimum frequency and impedance performance in signal, choke and filter applications. These Magnetics materials provide superior loss factor, frequency response, temperature performance, and product consistency.

Shapes: Toroids, E cores, U cores, RM, Pot cores, RS (round-slab), DS (double slab), EP, Special Shapes.

Applications: common mode chokes, EMI filters, other filters, pulse transformers, current transformers, broadband transformers, current sensors, telecomm data interfaces, impedance matching interfaces, handheld devices, spike suppression, and gate drive transformers.

Tape Wound Cores

Magnetics strip wound cores are made from high permeability magnetic strip alloys of nickel-iron (80% or 50% nickel), and silicon-iron. The alloys are known as OrthonoI[®], Permalloy 80, Supermalloy, 48 Alloy, Magnesil[®], and Supermendur. Tape Wound Cores are produced as small as 0.438" OD to more than 9" OD, in hundreds of sizes. For a wide range of frequency applications, materials are produced in thicknesses from 1/2 mil (0.013 mm) through 4 mils (0.102 mm). Cases are robust nylon and aluminum boxes, rated for 200°C continuous operation and 2,000 minimum voltage breakdown.

Applications: aerospace applications, radar installations, jet engine controls, power supplies, current transformers and other high reliability applications.

Bobbin Cores

Magnetics bobbin cores are miniature tape cores made from ultra-thin (0.000125" to 0.001" thick) strip material wound on nonmagnetic stainless steel bobbins. Bobbin Cores are generally manufactured from Permalloy 80 and OrthonoI[®]. Covered with protective caps and then epoxy coated, Bobbin Cores can be made as small as 0.05" ID and with strip widths down to 0.032". Bobbin Cores can switch from positive to negative saturation in a few microseconds or less, making them ideal for analog logic elements, magnetometers, and pulse transformers.

Applications: high frequency magnetic amplifiers, flux gate magnetometers, harmonic generators, oscillators, pulse transformers, current transformers, analog counters and timers and inverters.
